

# TECHNICAL MEMORANDUM

---

**TO:** Corey Driscoll Dunham, Chief Operating Officer, City of Syracuse  
Neil Burke, Director of Special Projects, City of Syracuse DPW

**FROM:** Andrew Frasier, Senior Transportation Analyst, SMTC

**DATE:** March 8, 2022

**RE:** Prioritizing Pavement Maintenance on City Streets

**CC:** James D'Agostino, Director, SMTC  
Mario Colone, Program Manager, SMTC

## SUMMARY

On behalf of the City of Syracuse, the Syracuse Metropolitan Transportation Council conducted an analysis of the City's road network to provide insight into prioritizing certain roads for pavement maintenance. The City was interested in determining roads where the investment of resources would be justified. This memo outlines the methods considered and the data included in this analysis, and an explanation of the final products. The SMTC conducted a similar analysis in 2020 and 2021.

Using available data, the SMTC developed a Priority Score on each applicable road segment. This score considered several variables, including pavement rating, traffic volumes, and functional classification, among others.

The approach considered in this analysis is just one of several possible data-driven approaches. The approach utilized data accessible by the agency and seeks to create a repeatable process that stands on solid analytical ground. The processes performed as a part of this analysis are not a substitute for a complete, network-wide asset management system. The output suggests roads which could be considered reasonable candidates for reconstruction in the 2022-2023 City Fiscal Year.

## Introduction

### Overview and Previous Efforts

Each program year, the Syracuse Metropolitan Transportation Council (SMTC) publishes a Bridge and Pavement Condition Management System (BPCMS) report to serve as a comprehensive clearinghouse for condition information on selected bridges and pavements throughout the Metropolitan Planning Area (MPA). Throughout its history, the BPCMS has contained different types of information varying in scope, depending on the needs of member agencies, federal regulations, and data collection methods. Most recently, the Pavement section of the report included condition information on all federal-aid eligible (FAE) roads in the MPA.

In 2019, in addition to compiling data on federal-aid eligible roads, the SMTC undertook a new effort – providing ratings on the entirety of the City of Syracuse’s road system. In keeping with past data collection efforts by the City, roads were rated on a block-by-block basis.

Stemming from this data collection effort, the City expressed interest in working with the SMTC to develop a list of streets which should be prioritized for paving, based on several variables. This process was completed in early 2020 and then again in 2021 as a pilot program effort.

The SMTC and the City compiled a list of variables to determine weights for pavement prioritization. The SMTC assigned these weights to different road segments on a block-by-block basis, using SMTC and City data and Geographic Information Systems (GIS) software. From these weights, each block received a *Priority Score*, which the City could use in developing plans for the Road Reconstruction budget. The SMTC recommended placing focus on those roads

which fell above the 75<sup>th</sup> percentile of Priority Score. Because it is often not cost efficient to pave only one block of road at a time, the SMTC also developed the *Weighted Average Priority Score*, to determine an overall priority of road corridors which could be paved, as opposed to just single blocks.

The City has found this process as a useful portion of their road reconstruction planning effort and has requested that the SMTC continue to develop this model each year.

### Identification of Process

SMTC staff explained, and the City of Syracuse acknowledged, that the limitations of the amount of data available would prevent the full analysis which an asset management program would normally entail. For example, the City does not have complete road inventory data which can be tied to a geographic centerline file via a unique identifier – thus, some roadway characteristics may be assumed or missing all together. The City has shown interest in cataloging data digitally to as a part of their commitment to data-driven decision-making processes – moving to this type of data storage will significantly improve asset management models such as this one.

A regular maintenance program already exists for the City’s unimproved (i.e., non-curbed) streets. A slurry seal is overlaid on these streets approximately every four years. The current program currently covers about one quarter of the unimproved system each year, and the maintenance cost is added to abutting property owners’ tax bills. As an established system, SMTC and City staff decided to leave this scheduled maintenance out of the pavement

prioritization pilot and focus instead on the improved system, which has a separate budget.

In discussions with City staff, the SMTC again agreed to utilize the following variables as candidates for this prioritization process:

- Pavement condition
- Annual Average Daily Traffic (AADT)
- Functional Classification
- Current planned other (non-paving) maintenance, such as work by National Grid or the Save the Rain project
- Proximity to major institutions
- History of water main breaks
- Existence of other major planned reconstruction projects
- Transit activity
- Emergency snow routes.

Additionally, the SMTC developed a way to better stratify roads functionally classified as local, which make up approximately two-thirds of the City's system. These roads often do not have extensive data to utilize in developing priorities. Using information from the current ReZone Syracuse draft document, the SMTC categorized local roads into three categories based on adjacent land use – Tier I, Tier II, and Tier III – and utilized this attribute as a part of this analysis.

## Description of Tasks

### Task 1: Data Collection

The goal of the project is to produce a series of filters that will eventually indicate potential priority road segments using the variables listed above. The SMTC will need to gather necessary data to achieve this goal. Some of the datasets live in-house at the SMTC, and others will have to be obtained through partnerships with the City of Syracuse or other entities. The table below illustrates the needed variables and the presumed entities.

Dataset	Agency
Pavement Condition	SMTC
AADT	SMTC, NYSDOT
Functional Classification	SMTC
Current Planned Maintenance	City of Syracuse, National Grid, Save the Rain
Major Institutions	SMTC
Water Main Breaks	City of Syracuse
Planned Reconstruction Projects	SMTC, City of Syracuse, NYSDOT
Emergency Snow Routes	City of Syracuse
Transit Boarding and Alighting	Centro
Local Road Class	City of Syracuse, SMTC
Weighted Average Priority Score	SMTC

From a GIS standpoint, the current pavement condition dataset is tied to the SMTC’s MPA Roads geodatabase. This spatial data will serve as the base dataset for all other data points collected.

AADT, where it exists, will be used to determine the number of vehicles travelling on a segment, and thus, provide a sense of a road’s importance to the overall network. AADT totals are being used from pre-2020 to mitigate the

effect of the COVID-19 pandemic on traffic patterns. Current planned maintenance and reconstruction (both paving related and non-paving related) will help show roads that should not be prioritized this year. Water main breaks may be an additional indicator of road quality – a road segment with several breaks likely has several cuts in the pavement, which impairs condition over time. Major institutions, such as hospitals and large employers, would indicate both a necessity for good pavement and the importance of managing any construction disruptions.

### Task 2: Filtering Roads

The process of prioritization will occur in two stages. The first stage will operate as a filtering process to select which roads should *not* be included in prioritization calculations. Based on the data collected and conversations with the City, the roads with the following attributes will not be considered as a part of the program. Note that mileages are approximate, and that one road segment may fall into several of these categories.

#### *Unimproved Streets (148 miles)*

Unimproved (i.e., non-curbed) streets are already part of a routine maintenance program, and therefore are not being considered as a part of this analysis. Previously, the City provided information on improved and unimproved streets in a tabular format. An effort to connect this tabular dataset with a spatial one resulted in some street data failing to translate, leaving some streets with an unknown type. To correct this issue, SMTC staff collected information on whether a road was improved or unimproved while conducting the road rating in 2020. This improved/unimproved assessment should not be considered official for

City engineering or record-keeping purposes, but as a planning-level effort appropriate for an analysis like this.

Some unknown street types remain, but have been reduced to 1.1 miles, down from 32 miles previously. They are included in “unimproved” for purposes of this analysis.

*Planned Reconstruction (32 miles)*

Streets where there are planned reconstruction efforts in the near future will also not be considered as a part of this analysis. These have been defined as pavement projects on the SMTC’s Transportation Improvement Program (TIP), streets noted on the City’s Reconstruction List, as well as streets identified through the City’s Dig Once initiative.

Additionally, roads identified as in the project area of the upcoming Interstate 81 project (as noted in the Preliminary DEIS) were also removed from consideration. Although these roads are not being considered for this specific effort, maintenance may be required before the Interstate 81 project is complete given the condition of some of the network in this area.

*Planned Maintenance in Right-of-Way (17 miles)*

Other, non-reconstruction work in the road right-of-way was also noted, and roads with maintenance plans in the immediate future were removed from consideration. The SMTC was able to acquire some data on National Grid plans in 2022 and 2023 as well as Save the Rain projects from 2022-2024.

*Pavement Condition (203 miles)*

Pavement scores of “Good” and “Excellent” were not considered as a part of this analysis and were removed from consideration. Scores of “Fair” or “Poor” remained.

After all filters were applied, the original 395 miles of City roads were reduced to approximately 93 miles for prioritization consideration. The second stage involved applying scores to the segments which remained based on other variables.

**Task 3: Weighting of Variables**

*Condition Rating*

The pavement condition was considered the most important variable, and as such, was given the largest weights of any variable.

Condition Score	Miles	Weight
3 (Very Poor)	0.3	8
4 (Poor)	11.5	8
5 (Poor)	42.3	6
6 (Fair)	37.3	4
(No Data)	1.2	0

*AADT*

Corridors which have higher traffic volumes are more likely to be traveled frequently by the public. Assigning these heavily traveled corridors a higher weight helps ensure a better use of City resources, by spending limited reconstruction dollars on popular travel corridors. AADT is not known for all segments. However, AADT is generally not available on low-volume, residential streets – therefore, streets with an unknown AADT were given the same weight as those with low AADT. AADTs from 2020 and 2021 were not used due to the effect of the COVID-19 pandemic on traditional traffic patterns.

AADT	Miles	Weight
Greater than 15,000	1.3	5
10,001 – 15,000	4.4	4
5,001 – 10,000	7.7	3
2,501 – 5,000	10.1	2
0 – 2,500	7.8	1
No Data	61.4	1

### Transit Activity

The City was interested in including additional focus on roads with higher transit activity. The COVID-19 pandemic had a significant impact on transit ridership. Therefore, average daily boarding and alighting data at bus stops in 2019 was provided by Centro to facilitate this calculation. “Activity” at a stop was defined as the sum of average daily boardings and alightings at that location. Stops with an average activity of less than 1 were removed from the analysis, as well as stops at the Centro Transit Hub. Additionally, only stops within 30 feet of a City road’s centerline were considered – this eliminated stops on the properties of locations like Syracuse University, Destiny USA, and local high schools, which are primarily off the City’s road network and therefore should not be considered as a part of the Reconstruction list.

The sum of total activity at considered stops was attached to each road segment. The total activity on segments were divided into percentile groups and the weights were assigned according to the scale below.

Transit Activity	Miles	Weight
29.5 – 491.8	5.4	4
12.1 – 29.4	4.0	3
4.7 – 12.0	3.4	2
1 – 4.6	3.1	1
No Activity	76.7	0

### Nearby Water Main Breaks

The City’s Office of Accountability, Performance, and Innovation supplied data on

<sup>1</sup> In search of an acceptable distance from the road centerline to search for water main breaks, SMTC staff calculated the distance, in meters, of each break to the nearest road segment centerline. Staff sought to remove outliers from the dataset before calculating an appropriate buffer distance. In statistics, a rule of thumb for calculating outliers is

the location of water main breaks from 2004-2021. Breaks did not always occur along the road centerline, and SMTC staff wanted to include breaks that may have occurred near the roadway, but not directly underneath, as these breaks may still have required a cut into the pavement to fix. Several pavement cuts, over time, will lead to condition degradation, especially if filled incorrectly. As such, the number of water main breaks could reasonably be considered an important factor in prioritizing pavement maintenance.

A 20-meter buffer was placed around each road centerline<sup>1</sup>, and the sum of the number of breaks in that buffer zone were added to each segment. Note that some breaks, such as those near intersections, were counted on multiple segments. Weights were assigned based on percentile values and are shown below.

Water Main Breaks	Miles	Weight
4 – 22	9.7	5
2 – 3	16.3	3
1	21.2	2
0	45.3	0

### Snow Emergency Routes

Roads considered snow emergency routes are of critical importance to the road network, either for the traveling public or for emergency services. As such, it is reasonable to attest that these roads should be maintained in a state of good repair.

Snow Emergency Route	Miles	Weight
Yes	22.9	2
No	69.7	0

any amount 1.5 times the interquartile range greater than the 75<sup>th</sup> percentile or less than the 25<sup>th</sup> percentile. Performing this calculation, staff were able to determine that most water main breaks occurred within 20 meters (approximately 60 feet) of the road centerline.

*Major Institutions*

The City expressed interest in prioritizing routes near major institutions, defined as hospitals, universities, and large employers. In this case, SMTC used employment data to identify businesses with over 250 employees. Given that the major employers in our region are both the local universities and the hospitals, an institution was *not* counted more than once. For example, Upstate is both a large employer and a hospital, but it was counted once as an institution and not twice.

The employment data is susceptible to accuracy issues. One common example is the reporting of *all* employees in a company at a single location. To avoid these issues, staff used professional judgement to cull or alter the list of large employers where appropriate.

Distance to Institution	Miles	Weight
1/8 mile	6.1	3
1/4 mile	10.5	2
1/2 mile	25.1	1
Greater than 1/2 mile	50.8	0

*Activity Level*

There is generally limited data on the portion of the City’s system functionally classified as local. These streets tend to be low-volume residential streets, the first leg and the last leg of the average person’s transportation journey. In Syracuse, local streets make up approximately two-thirds of the City’s road network.

Because the local streets comprise most of the road network and generally have fewer attributes available to analyze, the SMTC was

<sup>2</sup> Using the draft ReZone proposed zoning, the percentage of each land use for each block was tabulated. Tier III roads were either greater than 90% residential, greater than 90% industrial, or greater than 50% open space. Tier I roads were either over 90% commercial, over 90% MX-4/MX-5,

interested in using ancillary data to stratify this large block of roads into additional categories.

Adjacent land use can serve as an indicator of how many people use a road, even if there is no AADT data available. For example, roads which serve commercial or mixed land uses may see more vehicles than roads surrounded by residential uses or open space. The SMTC reviewed the ReZone Syracuse **draft** document to determine adjacent land uses for local roads and utilized this information to categorize local roads into three additional categories: Tier I, Tier II, and Tier III<sup>2</sup>. Note that these categories have no official bearing to the road network and are simply an analytical tool used to help separate the approximately 265 miles of local roads owned by the City.

Activity Level	Miles	Weight
Tier I Local Roads	4.4	5
Tier II Local Roads	34.9	3
Tier III Local Roads	25.7	1
Non-Local Roads (Arterials and Collectors)	27.5	0

**Task 4: Applying Score to Network**

The maximum possible score for all variables is 32. The appropriate score for each individual variable was tied to each road segment. The sum of all these variables, the Priority Score, was calculated.

After application, the Priority Scores ranged from 2 to 27. These scores were divided into percentiles (by number of segments), with the idea that segments scoring higher than the 75<sup>th</sup>

or over 90% Institutional use. Tier II roads were the remainder: a mix of residential (less than 90%), and other uses, such as MX-1, MX-2, and MX-3, and Planned Development. These Tiers were only assigned to roads functionally classified as Local.

percentile would advance for prioritization consideration.

Category	Lower Bound	Upper Bound	Approx. Mileage in Category
Minimum to 25 <sup>th</sup> Percentile Score	2	9	28
25 <sup>th</sup> to Median Score	10	11	23
Median to 75 <sup>th</sup> Percentile Score	11	14	24
75 <sup>th</sup> to Maximum Score	15	27	18

### Task 5: Identification of Priorities

Overall, any of the approximately 18 miles of road which fall above the 75<sup>th</sup> percentile of scores would be reasonable and prudent streets to include in the 2022 reconstruction list.

Having a larger pool to select from provides more options to the City, as needs may change throughout the development of the reconstruction list. These roads are listed in Appendix A of this memo.

In addition to providing the prioritized road segments at the block level, the SMTC calculated a connectivity score along longer segments, to promote economies of scale when paving. This score, the Weighted Average Priority Score<sup>3</sup>, gives the City an idea of the general priority of a road.

The Weighted Average Priority Score was calculated in two different ways. For roads not on the federal-aid system, the score was calculated along each road, based on road name. For roads on the federal-aid system, the same score was also calculated, but instead of at the road name level, smaller segments were used based on the SMTC’s City of Syracuse Traffic Count Program. Since FAE roads tend to be longer commuter routes, it did not seem practical to provide a Weighted Average Priority Score for the entirety of James Street, for example. These smaller subsections reflect segments which could be reasonably paved.

However, each of these new segments may still contain blocks which were filtered out of the process for several reasons (such as being unimproved, *et cetera*), so care should be taken in planning for reconstruction. These filtered blocks (with a score of 0, since they were removed prior to the scoring process) are still included in calculating the Weighted Average Priority Score – this allows a street’s priority to drop if it contains several blocks not considered in the analysis.

Each road is listed with its Weighted Average Priority Score, its Weighted Average Pavement Rating, and the total segment length. City staff would be able to select which streets they are interested in including, based on total mileage. This list is included in Appendix B of this memo. Roads with a Weighted Average Priority Score of 0 were removed from the list for brevity.

<sup>3</sup> The Weighted Average Priority Score was calculated by taking the average of each block’s score along a road (for non-FAE) or a count segment (for FAE) and weighting each block’s score using its

length. The formula  $\bar{P} = \frac{\sum p_i l_i}{\sum l_i}$  applies, where  $\bar{P}$  is the Weighted Average Priority Score,  $p_i$  is the Priority Score of the  $i$ th block on a segment, and  $l_i$  is the length of the  $i$ th block of a segment.

## *Conclusion*

Overall, this methodology is only one of several possible approaches to developing a priority list of segments to include in the 2022 Reconstruction Budget. SMTC Staff, through communication with City staff and based on available resources, developed a data-driven process which considers several variables considered important to a well-maintained road network.

Based on feedback, an increase in available data, and other needs, this methodology can change in the future. As is the case with all SMTC products, this process is intended to be used as a planning tool only.

## APPENDIX A – Individual Street Blocks with scores above 75<sup>th</sup> Percentile (Value higher than 14)
